This USDA-DHIA Sire Summary List contains the most recent estimates of transmitting ability for milk and fat yield, fat percent, and income of bulls evaluated during the sire summary runs of September 1973, January 1974, and May 1974.

The genetic evaluations are based on yield information on the bulls' daughters which are located in herds participating in the Official Dairy Herd Improvement and Dairy Herd Improvement Registry recordkeeping plans. The information used is obtained by the USDA's Agricultural Research Service (ARS) from Dairy Herd Improvement Associations (DHIA's) that are affiliated with the National Cooperative Dairy Herd Improvement Program.

The USDA-DHIA Sire Summary List is published annually by ARS following the May sire summary run. It is usually available for distribution around September 1. Since it is an annual publication, no general mailing list is maintained. Dairymen and other interested persons can obtain a copy, as long as supplies last, by contacting the extension dairyman advising on dairy cattle breeding at the Agricultural University in their State (see table 8, page xix) or by writing to the Animal Improvement Programs Laboratory, Building 263, BARC-East, Beltsville, Maryland 20705. There is no charge for these books.

Persons desiring maximum benefit from the information contained in this book should read the introductory material prior to attempting to interpret the sire summaries.

USDA-DHIA SIRE SUMMARY LIST, MAY 1974

Containing Sire Summaries for Ayrshire, Guernsey, Holstein, Jersey, Brown Swiss, Milking Shorthorn, Red Dane, and Mixed Breed Sires

INTRODUCTORY MATERIAL

By Frank N. Dickinson, Ben T. McDaniel, H. Duane Norman, Gerald J. King, Jeffrey F. Keown, and Rex L. Powell 1/

This USDA-DHIA Sire Summary List contains information for 335 Ayrshire, 1,356 Guernsey, 8,230 Holstein, 1,467 Jersey, 502 Brown Swiss, 129 Milking Shorthorn, 1 Red Dane, and 1 Mixed Breed sires. May 1974 summaries were compiled from Official DHI and DHIR lactation records received before April 13, 1974. January 1974 summaries were based on data received before December 20, 1973. September 1973 summaries were based on data received before August 24, 1973.

A sire summary is compiled for a sire when 10 or more of his daughters have lactation data and herdmate records reported. Sires in the following categories are summarized in this publication:

- (1) Those for which sufficient information was available for the first time.
- (2) Those reported to be active in artificial insemination on January 1, 1974, or later.
- (3) Those for which enough additional information was available to warrant a resummary.
- (4) Those for which special requests for summaries were received.

Details on rules for summarizing and resummarizing sires are given in the April 1968 Dairy Herd Improvement Letter, ARS 44-202.

All production records used in USDA-DHIA Sire Summaries consist of lactation records of 305 days or less that have been standardized to a twice-a-day milking, mature-equivalent (ME) basis. When more than one lactation was available for a cow, all records for both the cow and her herdmates were averaged and used to represent her performance.

^{1/} Frank N. Dickinson is chief, Animal Improvement Programs Labortory (AIPL), Animal Physiology and Genetics Institute, U.S. Dept. of Agr., Agr. Res. Serv., Beltsville, Md.; Ben T. McDaniel is now professor, North Carolina State Univ., Raleigh, N.C.; H. Duane Norman is a research animal scientist (genetics), AIPL; Gerald J. King is a dairy husbandman, AIPL; Jeffrey F. Keown is a research animal scientist (genetics), AIPL; and Rex L. Powell is a research geneticist (animal), AIPL.

Incomplete lactation records were projected to a 305-day basis by factors that take into account breed, age, milk, and milk fat if they were reported as having been terminated for the following reasons:

> (1) At least one valid test followed by two consecutive. missed tests.

Cow sold from the herd.

(3) Cow died during lactation.

(4) Lactation ended by an abortion.

The projection factors used were published in the August 1965 Dairy Herd Improvement Letter, ARS 44-164.

Lactations made on three- or four-times-a-day milking were standardized to a twice-a-day (2X) basis with Kendrick's factors, published in ARS 52-1, January 1955, and more recently in the January-February 1972 Dairy Herd Improvement Letter, ARS 44-239.

The age-adjustment factors that were used in standardizing these records to ME considered the effects of breed, geographical region of the United States, and season of calving. They were published in the February 1967 Dairy Herd Improvement Letter, ARS 44-188.

Records that were deleted and not used in compiling summaries were:

- (1) Those coded as complete but less than 180 days in length.
- (2) Those coded as incomplete but less than 15 days in length.
- (3) Those estimated for two or more consecutive test periods.
 (4) Those initiated by abortion.
 (5) Those that had no herdmates in 5-month moving season.

Currently reported lactation records were accepted into master files and used in the sire summaries only if the interval from calving date to production-rum date (April 17, 1974) exceeded 364 days. This lapse-time interval has been tested and shown to be effective in reducing the high incidence of incomplete records in early sire summaries. Records of cows calving after April 17, 1973, were set aside and will be reentered in the next appropriate sire summary.

COMPILATION OF SIRE SUMMARY

The herdmate comparison is useful, because it largely removes from the estimate of a sire's breeding value complications arising from herd, year, and season-of-calving variations in production. Herd-year-season yield is based on a 5-month moving average. The appropriate herdmate average for each daughter of a sire is obtained by averaging all records of daughters of other sires calving in the herd in the same month as that daughter, in the previous 2 months, and in the succeeding 2 months (that is, the herd-year-season). For example, the herdmate average for a sire's daughter that calved in March is obtained by averaging the production of all cows, except her paternal sisters,

that calved in that herd from January through May. However, lactations of covereported without sire identification were not used as herdmates. All comparisons included in these summaries are on a within-breed-of-sire basis.

Adjusted Herdmate Average

Because the usefulness of the herdmate average is dependent in part on the number of herdmates available, the herdmates' production is adjusted to place the herdmate data on a comparable basis for all daughters. For each individual lactation of a sire's daughter, the herdmates' average is adjusted as follows:

AHMA = RBYSA +
$$\frac{N+M}{N+M+1}$$
 (HMA minus RBYSA)

where:

AFMA = Adjusted herdmate average for each lactation;

RBYSA = Regional breed-year-season average;

NHM = Number of herdmates; and

HMA = Herdmate average.

The regional breed-year-season averages were calculated from the 305-day, 2X, ME, Official DHI and DHIR records of cows that calved from January 1, 1960, to April 17, 1973. Three regional groupings are used for Ayrshire and Brown Swiss, 4 for Guernsey and Jersey, and 14 for Holstein. The averages for Milking Shorthorn and Mixed Breed are based on all cows that calved in the United States for the year-season in question. The primary cause of differences in the number of regions used for each breed was the number of lactation available to compute factors accurately. The States comprising each region are shown in table 7, page xviii.

Breed Averages

The breed averages used to regress the adjusted herdmate averages in computing sire summaries that appear in this book were compiled from all lactation records of Official DHI and DHIR cows of each breed that calved in 1970 and 1971. These averages are shown in table 1.

Table 1.--Breed averages used for sire summaries in this book on a 305-day, 2X, ME basis

Breed	Cows	Mi1k	Fat	Fat
	No.	Lb	<u>*</u>	<u>Lb</u>
Ayrshire	45,487	11,665	3.86	450
Guernsey	199,516	10,223	4.59	469
Ho1stein	3,074,475	14,627	3.60	526
Jersey	206,345	9,356	4.95	463
Brown Swiss	53,935	12,705	3.99	507
Milking Shorthorn	6,189	10,468	3.68	385
Red Dane	158	13,728	3.92	538
Mixed Breed	26,528	14,975	3.60	539

Weighting Projected Records

It has long been known that the accuracy of projecting a lactation record is proportional to the number of days in milk. This principle was used to adjust incomplete lactations in this USDA-DHIA Sire Summary List. The procedure is as follows:

Adj. Dau. Rec. = AHMA + r; (Proj. Dau. Rec. - AHMA)

where: Adj. Dau. Rec. = Adjusted daughter record;

AHMA = Adjusted herdmate average for each lactation;

r_i = The phenotypic correlation between a record with
 i months in milk and a 305-day record; and

Proj. Dau. Rec. = Projected daughter record (305-day, 2X, ME).

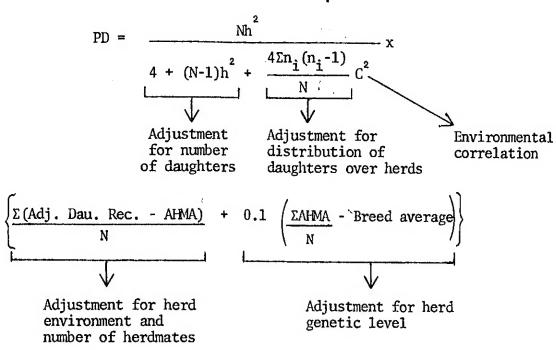

The phenotypic correlations (r_i) for 2-year-old and for older cows are shown in table 2. As an example of their use, a projected record of 15 through 45 days duration made by a 2-year-old cow would receive only 72 percent as much weight as a complete 305-day lactation. The adjusted daughter records for a cow are weighted equally in calculating the adjusted daughter average when there is more than one lactation.

Table 2.--Phenotypic correlations (r_i) between records of i months duration and 305-day lactations

				Months	in Milk	ζ				
Cows	1	2	3	4	5	- 6	7	8	9	10
2-yr-olds	0.72	0.83	0.88	0.92	0.94	0.96	0.97	0.98	0.99	1.00
3-yr and older	.60	.74	.82	.86	.91	.93	.96	.98	.99	1.00

Predicted Difference for Milk and Fat Yields

The measure of transmitting ability for milk and for fat is the Predicted Difference (PD). This value is the expected average deviation of a bull's progeny from their herdmates in breed average herds. To determine a bull's effective PD in a given herd, one-tenth of the difference between the herd average yield and the breed average should be subtracted algebraically from the bull's PD. For example, a bull with a +1,000 pounds PD for milk in breed average herds would have an effective PD of +800 pounds in herds averaging 2,000 pounds below breed average. The factor of "one-tenth" represents the average genetic portion of interherd differences in yield that affect an animal's effective transmitting ability in different herds. When each daughter of a bull has only one record, the PD is computed as follows:

where:

N = Number of daughters in the summary;

h² = Heritability of milk and fat yields
 developed from a nationwide sample of
 records from paternal half-sisters
 = 0.19;

n_i = Number of daughters in the ith herd. If
 a bull had nine daughters in herd 1, and
 six daughters in herd 2, Σn_i(n_i-1)
 = 9 (8) + 6 (5);

C² = The correlation among half-sisters that
 calved in the same herds. The relationship
 is one that results from common environment
 and certain genetic factors not accounted for
 by differences among bulls. The half-sister
 records are expressed as deviations from
 herdmates
 = 0.14;

Adj. Dau. Rec. = As defined on page iv; and

AHMA = As defined on page iv.

When one or more daughters of a bull have multiple records, the value Σw_j is substituted for N in the adjustment for the number of daughters. The formula for PD then becomes:

PD =
$$\frac{\sum w_{j}h^{2}}{4 + (\sum w_{j}-1)h^{2} + \frac{4\sum n_{i}(n_{i}-1)}{N}C^{2}} \times$$

where:

$$w_{j} = \frac{r_{j}R}{R \left[1 + (r_{j} - 1) R\right]} = 1.00 \text{ for one record;}$$

$$1.33 \text{ for two records;}$$

$$1.50 \text{ for three records;}$$

$$1.60 \text{ for four records;}$$

$$1.67 \text{ for five records;}$$
etc;

and

R = Repeatability of individual records = 0.50;

r; = Number of records on the jth cow.

Adj. Dau. Avg. = The average of the adjusted records for the ith daughter.

AHMA = The average AHMA for the jth daughter.

Predicted Difference for Fat Percent

The measure of a bull's transmitting ability for fat percent is the PD for fat percent. It is the expected average deviation of a bull's progeny from their herdmates in breed average herds.

It is computed as follows:

PD fat % =
$$\frac{\text{(PD for fat + Breed avg. fat)} \times 100}{\text{PD for milk + Breed avg. milk}}$$
 - Breed avg. fat %.

Repeatability of Predicted Difference for Milk and Fat Yields

The precision with which the PD for milk yield and for fat yield will estimate a bull's transmitting ability for milk and fat relative to other bulls of that breed depends on the following factors:

Number of daughters in the summary.
 Number of herds in which the daughters are located.
 The distribution of the daughters among these herds.
 Number of lactations per daughter.

The measure of precision of the PD is the Repeatability of the sire summaries. The formula below is the same as the first portion of the formula for PD, given on page V. When each daughter in the summary has a single record, this is computed as follows:

Repeatability of a sire summary =
$$\frac{Nh^{2}}{4 + (N-1)h^{2} + \frac{4\Sigma n_{i}(n_{i}-1)}{N}C^{2}}.$$

The various terms of the formula are defined on page v.

When some daughters have multiple records, the formula for Repeatability becomes:

$$\frac{\sum w_{j}^{h}}{4 + (\sum w_{j}-1)h^{2} + \frac{4\sum n_{i}(n_{i}-1)}{N}} C^{2}$$

Where the terms are the same as described previously.

The Repeatability formula is the regression factor that is used to adjust the daughter-herdmate deviation for number of daughters, records per daughter, distribution of daughters in herds, the heritability of milk and milk fat yield, and the within-herd, half-sib correlation. The parameters used in computing the Repeatability of sire summaries are based on the best research information presently available. The value of h^2 (0.19) results in a Repeatability of $\frac{N}{N+20}$ where all daughters have only one record and are in

different herds. The value of C² (0.14) is based on USDA research with nationwide samples of data.

Effective Daughters Per Herd

The term "effective daughters per herd" is an index of the distribution of daughters over herds in terms of the distribution's effect on the Repeatability of the sire summary. If each daughter were in a separate herd, which is the optimal distribution in terms of the Repeatability, or reliability, of the sire summary, the effective daughters per herd would be 1.0. Thus the lower the value for effective daughters per herd, the more reliable the proof, for a fixed number of progeny. The calculation of effective daughters per herd is based on the herd in which each daughter made her first record. The formula for the effective daughters per herd is:

$$1.0 + \frac{\sum n_i (n_i - 1)}{N}$$

where n_{i} and N are defined the same as previously.

When each daughter is not in a different herd, the effective-daughters-per-herd term indicates how they are distributed. For instance, assume that a bull has 25 progeny in 5 herds. They can be distributed in any manner from 5, 5, 5, 5, and 5, to 21, 1, 1, 1, and 1, but this is not shown by the number of daughters and herds. The effective daughters-per-herd in the first case is 5.0, that is, 5(5(4))/25 + 1.0, and in the second case is 17.8, that is, 21(20)/25 + 1.0. Any time the effective-daughters term deviates much from the average number of daughters per herd, most of the progeny are grouped in one or a few herds. Obviously, when a bull has many daughters in many herds, this parameter does not have much additional value for interpreting the sire summary. However, it is most useful when evaluating a bull on the basis of a relatively small number of daughters in a few herds.

INTERPRETATION OF SIRE SUMMARIES

Predicted Difference for Milk, Predicted Difference for Fat, and Repeatability

Over a long period, the genetic improvement resulting from the bulls used in a herd will be largely dependent on the PD of those bulls. The PD's are the best available estimates of a bull's transmitting ability for milk and fat. Transmitting ability is defined as one-half of the breeding value. Breeding value, therefore, is measured on the basis of an animal's complete genotype, whereas transmitting ability is a measure of the average worth of a random one-half of the genotype that is present in a sperm or an egg. (USDA-DHIA Cow Indexes are also expressed in terms of transmitting ability.) The PD's in these sire summaries are computed by using the Herdmate Comparison Method. The herdmate comparison has been shown to be effective in reducing environmental influences resulting from herd, year, and season of calving.

The Repeatability value is an index of reliability that tells how sure we are that the PD's for milk and fat reflect an individual bull's true transmitting ability. A confidence interval indicating the likelihood that the bull's true transmitting ability will fall within these limits can be set about ability lies within these confidence limits. The greater the Repeatability value, or confidence factor of a summary, the greater the chance that the PD is close to the true transmitting ability of the bull for milk and fat yield. For individual bulls of various breeds are given in table 3. Repeatability and Repeatability will have transmitting abilities that fall within these

Table 3.--A comparison of 60- and 80-percent confidence intervals by breed for Predicted Differences at given Repeatability levels

Repeatability (percent)	60-percent confidence interval	80-percent confidence interval
	<u>Lb</u>	Lb
Brown Swiss and H	lo1steins	
20 30 40 50 60 70 80 90	+414 +387 +358 +327 +293 +253 +207 +146	+630 +589 +546 +498 +446 +386 +315 +223
Ayrshire, Guernse 20 30 40 50 60 70 80 90	y, Jersey, Milking Shorthorn, Red I +301 +281 +261 +238 +213 +184 +150 +106	Dane, and Mixed Breed +458 +429 +397 +362 +324 +281 +229 +162

As an example of the use of this table, assume that a Holstein bull has a PD of +800 pounds for milk, with a Repeatability of 70 percent. The 80-percent confidence interval on this PD is +386 pounds. This means that there is an 80-percent likelihood that this bull will have a true transmitting ability between +414 pounds and +1,186 pounds.

The choice between two bulls with similar PD's involves less gamble when the bull with the higher Repeatability value is selected. However, one should keep in mind that PD, not Repeatability, determines genetic progress in the long run. Also, because of the sampling nature of inheritance, any one daughte of a bull may deviate widely from the level of performance that would be expected based on her sire's PD. Therefore, a bull's transmitting ability should not be judged from just a single daughter or even on the basis of very few daughters.

Repeatability values have also been used to construct tables that show the probabilities that bulls with given PD's are above breed average in transmitting ability. These tables are given in the April 1968 Dairy Herd Improvement Letter, ARS 44-202, pages 22 and 23.

Tables that show probabilities that one bull is superior to another for various PD's and Repeatabilities are given in the December 1968 Dairy Herd Improvement Letter, ARS 44-207, pages 9, 10, and 11.

Predicted Difference for Income

Even though the transmitting abilities of bulls and cows have been, for the most part, evaluated separately on the basis of milk and fat yield, the economic value of the milk produced depends on both the quantity of milk and its milk solids content. At present in most milk-marketing areas of the United States, total income from milk produced depends upon the bulk and the milk fat percentage. For this reason, an economic index has been added to each bull's summary to predict gross income in relation to breed average based on the bull's PD's for milk and fat. This economic value should help to simplify selection among bulls of the same breed. This economic index is based on gross income. Since the relationship between gross income and net income is quite high, selection based on the PD for total income should be effective for increasing net income as well.

PD for income permits the direct comparisons of individual bulls to breed average in the same manner as do PD's for milk and fat, based on the income expected from their daughters. The income values are computed from 305-day, 2X, ME production, the same as are PD's for milk and fat.

The formula for computing the PD for income for a specific bull is:

$$PD_{\$} = (PD_{m}) \times (M_{\$} - F_{\$} \times B) + (PD_{f}) \times (F_{\$})$$

where:

 $PD_{\$}$ = The PD for income in dollars;

 PD_{m} = The PD for milk in pounds;

 PD_{f} = The PD for fat in pounds;

 $M_{\$}$ = The price paid for a unit of milk at the base test;

= $$0.070/1b \ \underline{2}$;

^{2/} The average U.S. milk price for 1973 was \$7.00/cwt for 3.5-percent milk, and the average fat differential was \$0.084/0.1 percent/cwt. Source: Dairy Situation, Economic Research Service, USDA, DS-349. March 1974.

F_{\$} = The fat differential, or the price paid for a unit of fat and other associated solids;

$$=$$
 \$0.84/1b 2/; and

B = The base test;

= 0.035. 2/

The average 1973 U.S. prices for milk and milk fat were used to calculate the value of production for individual bulls. 2/

Substitution of the 1973 U.S. average prices for milk and fat results in a formula that can be used to calculate $PD_{\$}$ for any bull:

$$PD_{\$} = PD_{m} \times (\$0.070/1b - \$0.84/1b \times 0.035)$$

$$+ PD_{f} \times (\$0.84/1b);$$

$$= PD_{m} \times (\$0.070/1b - 0.0294/1b) + PD_{f}$$

$$\times (\$0.84/1b);$$

$$= PD_{m} \times (\$0.0406/1b) + PD_{f} \times (\$0.84/1b)$$

$$= 0.0406 PD_{m} + 0.84 PD_{f}.$$

Example:

Calculate the PD for dollar income for a bull having PD's of +1,000 for milk and +30 for fat.

PD's for income (PD $_{\$}$) are shown in table 4 for various levels of PD milk and PD fat. These values are based on the 1973 U.S. average prices for milk and fat given on the preceding page.

A study in 1970 showed that evaluating bulls using the average prices of \$5.50/cwt, for 3.5 percent milk and \$0.083/0.1 percent/cwt fat differential resulted in nearly the same ranking of bulls as when the 3.5 percent-based milk prices were either \$4.50/cwt (manufacturing milk price) or \$7.00/cwt

TABLE 4.—THE ADDITIONAL VALUE OF MILK EXPECTED OF THE DAUGHTERS OF BULLS OR COWS ACCORDING TO PREDICTED DIFFERENCES. UR. COW. INDEXES FOR MILK AND. FAT. (BASED. ON A. PRICE OF \$7.00 PER MUNDRED POUNDS OF MILK MAVING 3.5% FAT AND A DIFFERENTIAL OF \$0.084 PER 0.1% PER CWT.)

(Class I price). The correlations between bull's PD's for dollar income (based on average U.S. prices) and gross income from either the manufacturing or Class I prices were above 0.99 for the Ayrshire, Guernsey, Holstein, Jersey, and Brown Swiss breeds.

Correlations between PD milk or PD fat with dollar value were lower (0.85 to 0.97). This indicates that dollar value at U.S. average prices is a better predictor of economic value for other markets such as manufacturing or Class I than individual PD's for milk or fat.

Very little information is available at present on the ability of individual bulls to transmit higher protein or solids-not-fat content. Such information will be incorporated into PD's for income at some later time when milk pricing is based on these components, and an evaluation on individual bulls for these traits becomes available.

Additional Information on the Sire Summaries

Situations occasionally arise that can cause a PD to be an inaccurate estimate of a bull's transmitting ability. Some of these are:

- (1) Preferential treatment of daughters over their herdmates.
- (2) Daughters of only one or a very few bulls represented among the herdmates.
- (3) None or only a few herdmates of the same age as the daughers of the bull.
- (4) A selected sample of the bull's daughters is available for the summary.

These situations are most likely to occur among bulls with low Repeatabilities (17 to 40 percent), although they can occur sometimes in bulls with moderate Repeatabilities (41 to 70 percent). For these reasons, dairymen are cautioned against breeding a large part of their herd to any single low-Repeatability bull.

The presence of ** in percent incomplete first lactation (% 1st inc) indicates that fewer than one-half of the bull's daughters have had first records reported. This frequently means that a selected sample of daughters has been reported. Therefore, the summary of the bull with "**incomplete first lactations" should be interpreted with caution.

The format of the sire summaries is explained in figure 1. The location and meaning of each item of data are given.

The State codes used in the National Cooperative Dairy Herd Improvement Program are shown in table 5. These codes can be used to determine States in which daughters of bulls are located.

When a bull is, or has been, in an AI stud, the USDA-DHIA Sire Summary List shows the sire's AI stud number, or the last organization that owned him. The list of AI organizations that have operated in the United States in recent years is shown in table 6. This list has been compiled from reports received by the Animal Physiology and Genetics Institute, ARS. Some organizations listed in table 6 may no longer exist, but are referred to because the sires that they owned are summarized. An asterisk (*) preceding the name of an AI organization indicates that the organization was reported as being active on January 1, 1974. The old State and stud codes are given on the left. The new 2-digit stud codes for use from now on are given on the right.

Table 7 shows the grouping of States used in regional breed-year-season averages.

Table 8 is the list of extension dairymen advising on dairy cattle breeding programs in each State.
